Abstract

The Paris Agreement commits state parties to a global adaptation goal and the inclusion of adaptation into their National Communications. This requires national level planning, monitoring and reporting and methods for effective global-scale adaptation tracking. However, unlike mitigation, where clear targets and goals have been agreed, adaptation is a process with uncertain and changing goals and risk context. . Assessing adaptation plans and strategies can provide valuable insights into ongoing adaptation policy, because the plans are important to institutions and organisations, and give good indications of priorities and institutional thinking. To assess how adaptation planning aligns to the Paris Agreement, this paper used Article 7 of the agreement to develop criteria and applied these to assess national adaptation plans and strategies available in English from least developed, developing and developed countries. We find that there is significant consistency in current national adaptation planning, which lays groundwork for assessment and evaluation of adaptation under the Paris Agreement. The results suggest that adaptation planning aligned to the Paris Agreement can help bring a different focus to development pathways that promotes synergies rather than trade-offs between environmental, social and economic goals. Importantly, tracking adaptation planning can help ensure the continued mobilisation of the parties, guide adaptation planning nationally and support global-scale consistency in planning and action.

1. Introduction

Adaptation to climate change is increasingly important as the irreversible impacts of climate change continue to grow (Archer et al., 2009; Solomon et al., 2009). The Paris Agreement commits state parties to a global adaptation goal and the inclusion of adaptation into their National Communications (Helgeson and Ellis, 2015; Magnan and Ribera, 2016; UNFCCC, 2016). This requires national level planning, monitoring and reporting and methods for effective global-scale adaptation tracking (Craft and Fisher, 2016; Ford et al., 2015). The Conference of the Parties (CoP23) in Bonn saw various adaptation-related convention items discussed, such as progress in the Nairobi Work Program (SBSTA 47) to support national adaptation planning, the role of the Adaptation Fund, and how to track, monitor and report on the agreed outcomes from Paris including the global goal on adaptation.

Assessing or measuring adaptation ‘success’ on a global scale is a different challenge compared to mitigation success. In light of the Paris Agreement, mitigation now has a clear goal for assessing success: holding the increase in the global average temperature to well below 2 °C above pre-industrial levels and pursuing efforts to limit the temperature increase to 1.5 °C above pre-industrial levels. In contrast, adaptation is a process with uncertain and changing goals and risk context; for example, less mitigation will result in greater need for adaptation. Hence, it is much harder to define a similar ‘final outcome’ for adaptation – there is no clear, universal measure nor a point in time when it can be said that globally, adaptation to climate change has been achieved. Rather, given that that climate effects of CO₂ releases to the atmosphere will persist for tens, if not hundreds, of thousands of years into the future (Archer et al., 2009), it is likely that adaptation will have to be an ongoing, ‘forever’ activity. Thus while there is significant discussion about approaches, adaptation monitoring and evaluation is harder to perform at any scale; local, project level, national or global level (Christiansen et al., 2018; Craft and Fisher, 2016; Magnan, 2016; Magnan and Ribera, 2016). Hence, global-level adaptation assessment is more heavily reliant on assessing the processes that are undertaken as part of adaptation, with an assumption that these processes and associated outcomes will increase the likelihood that adaptation is advanced globally (Craft and Fisher, 2016). Importantly, tracking adaptation planning at this level can help ensure the continued mobilisation of the parties, guide adaptation planning nationally and support global-scale consistency in planning and action.

Assessing adaptation plans and strategies can provide valuable insights into ongoing adaptation policy but studies comparing plans tend to focus on developed countries and local level action (Aguilar et al., 2018; Araos et al., 2016; Biesbroek et al., 2010; Mullan et al., 2013). The Paris Agreement lays out a set of commitments and guidelines for adaptation efforts in Article 7. To date, however, there has not been an assessment of the extent current national adaptation plans

are consistent with Article 7 or discussion of what Article 7 might mean for adaptation planning.

This paper seeks to fill these gaps by developing criteria based on Article 7 to assess plans and strategies available in English language from least developed, developing and developed countries. The plans are important for institutions and organisations, and give good indications of priorities and institutional thinking. Assessing the plans, therefore, according to criteria developed from the Paris Agreement can help track how national priorities and thinking reflect or contrast with the international agenda. The paper will answer the question ‘How do national level planning documents currently align with the Paris Agreement on adaptation?’ and in doing so consider how national priorities and institutional thinking might change to better reflect international commitments.

The paper is organised as follows: the next section reviews adaptation planning and international policy and explains how adaptation tracking has changed. The third section explains the methods used to assess national adaptation plans and strategies and to compare these assessments with national level data on vulnerability and other socio-economic indicators, while the fourth section presents the results of these assessments. This is followed by a discussion of the results, including the implications for implementation of Article 7 at international and national levels and recommendations for how this process could be improved. The paper ends with conclusions and suggestions for further research in this area.

2. Background

2.1. Adaptation and International Policy

Mitigation has been the major focus of international negotiations on climate change with the Paris Agreement resulting in a clear commitment to significantly mitigate greenhouse gas emissions (Kinley, 2017), although action remains uncertain and vulnerable to political changes (Clemencon, 2016; Höhne et al., 2017). In contrast, adaptation was considered for a long time to be a secondary policy response given that the main objective of the United Nations Framework Convention on Climate Change (United Nations, 1992) is to stabilize greenhouse gas concentrations in the atmosphere at a level that would prevent dangerous anthropogenic interference with the climate system. Adaptation, therefore, has typically received less attention than mitigation in UNFCCC deliberations (Khan and Roberts, 2013). However, as the impacts of climate change became clearer and the scope of necessary actions better understood (Solomon et al., 2009), adaptation has received increasing attention in policy, practice and

1 research. The agreements arising from the annual Conference of the Parties (CoP) provide a
2 history of how adaptation, and adaptation tracking, has evolved as a policy issue within the
3 UNFCCC process (Figure 1). Thus, the importance of adaptation has increased over the last 30
4 plus years with it being gradually and more substantially included in the negotiated outcomes
5 (Christiansen et al., 2018). Efforts to track adaptation have only recently begun to consider how
6 national planning might be monitored, reported and compared at an international level as part
7 of the Nationally Determined Contribution (NDC) process.

8 The original Convention included reference to Parties taking account of adaptation and
9 recognising the particular vulnerability of nations to various impacts such as sea-level rise),
10 but gave no guidance on how adaptation might be tracked (United Nations, 1992). Three key
11 outcomes for adaptation from the UNFCCC negotiations were (1) the Least Developed
12 Countries (LDC) Work Programme in Marrakesh CoP 7 in 2001, (2) Nairobi Work Programme
13 (NWP) CoP 12 in 2006, and (3) the Cancun Adaptation Framework (CAF) in CoP 16 in 2010
14 (UNFCCC, 2014a). These mechanisms focus on enabling adaptation in developing country
15 contexts, which reflects the prevailing view of adaptation being an issue for developing
16 countries than for developed ones. National Adaptation Programmes of Actions (NAPAs)¹
17 initiated at COP7 in 2001 as part of the LDC Work Programme (“Marrakesh Agreement to the
18 United Nations Framework Convention on Climate Change,” 2001) were designed to focus on
19 urgent adaptation needs of the Least Developed Countries (LDCs). To date, 39 LDCs have
20 developed NAPAs (UNFCCC, 2014b). The focus on tracking adaptation at this stage was how
21 to identify and prioritise adaptation needs. In Marrakesh, the focus became the LDCs, with
22 adaptation becoming closely tied to development. Although some of these countries are more
23 vulnerable to the biophysical impacts of climate change, the focus was on the lack of capacity
24 to respond, combined with the political driver of poorer countries seeking support from
25 wealthier countries, for a variety of reasons.² As a result, LDC has become a sort of short hand
26 for most vulnerable, even if label this is over-simplistic and potentially unhelpful (Barnett,
27 2017). The NAPA process specifically helped LDCs assess their priorities through a set of
28 criteria and list of potential adaptation actions. This process was largely country-driven, with

¹ The differences between National Adaptation Programmes of Action (NAPA) and National Adaptation Plan (NAP) National Adaptation Plans and National Adaptation Strategies (NAS) is discussed in Section 2.2.

² Adapting equitably means that wealthier countries should support all developing countries, as they have not benefited as much from the economic growth driven by burning fossil fuels and land use changes that have caused climate change. However, there are other considerations – a general international focus on development and the formation of negotiating blocs to push for further support for developing countries.

- 1 guidance and resources mobilised by the UN but with limited guidance at an international level
- 2 on how to prioritise or track the adaptation actions chosen by each country..

Paris Agreement (CoP 21, 2015)

Specific article 7 for adaptation in the Convention text, including Global Adaptation Goal; institutional structure for Loss and Damage.

Durban Agreement CoP 17 (2011)

Durban 2011 finalises language on Loss and Damage (L&D) (Durban Agreement)

Doha CoP 18 (2012), Warsaw (CoP 19, 2013) and Lima (CoP 20, 2014)

The Doha Climate Gateway; Warsaw 2013 establishes L&D Committee; Lima Adaptation Knowledge Initiative

Cancun Agreement CoP 16 (2010)

Establishment of the Cancun Adaptation Framework and the Adaptation Committee

Copenhagen Accord COP 15 (2009)

Acknowledged the need to urgently consider adaptation but little practical guidance as to how.

Bali Roadmap CoP 13 (2007)

Pledged support to implement and support 'urgent adaptation' in least developing countries.

Nairobi Work Programme CoP 12 (2006)

Work program on impacts, vulnerability and adaptation (VIA); Adaptation Knowledge Portal to support enhanced adaptation action.

CoP 2 (1996)

First steps: vulnerability and adaptation assessments in national communications

Marrakesh Accords CoP 7 (2001)

Adoption of 'realist' view: adaptation as a necessary response; agreement to finance CCA. National Action Plans for Adaptation (NAPAs) introduced.

Figure 1: Key adaptation decisions and initiatives emerging from UNFCCC CoP process.

The Nairobi Work Programme (NWP) introduced in CoP 12 (2006) made impacts, vulnerability and adaptation its key priorities, with the establishment of the Adaptation Knowledge Portal to share knowledge and lessons learned around adaptation. The focus for tracking was on assessing impacts and vulnerability. The following Bali Roadmap (CoP 13, 2007) and the Bali Action Plan had adaptation as a separate pillar but with a rather broad definition (Harmeling and Bals, 2008). The operationalisation of the Adaptation Fund at CoP 13, after the framework had been agreed at CoP 7, included agreement to evaluate and audit activities supported by the Fund, resulting in a need for indicators to measure the monitoring and evaluation of funded adaptation actions. Currently, the Adaptation Fund, and similar funds such as the GEF and GCF, use a combination of quantitative and qualitative indicators, e.g.: number of beneficiaries; percentage of households having more secure access to livelihood assets; percentage of population aware of adverse impacts of climate change; capacity of staff to respond; and integration of climate change into national policies (Christiansen et al., 2018).

1 The Copenhagen Accord that emerged from CoP 15 (2009) had little new to say on adaptation.
2 In contrast, the following CoP at Cancun (CoP 16, 2010) resulted in several agreements, one
3 of which focused on adaptation; the others focused on mitigation and financial, technology and
4 capacity building. The Cancun Agreements affirmed that adaptation should be given the same
5 priority as mitigation and the Cancun Adaptation Framework was established ‘with the
6 objective of enhancing action on adaptation’ (point 13) (“Cancun Agreement to the United
7 Nations Framework Convention on Climate Change,” 2010). The Cancun Agreements also
8 established an Adaptation Committee (AC) as an advisory body to the CoP, partly tasked with
9 developing ways to assess adaptation (Adaptation Committee, 2016). The Agreements also
10 established a process to formulate and implement NAPs, with guidelines that include
11 ‘reporting, monitoring and review’. There was continued focus on project-level assessment of
12 adaptation actions, but also greater guidance from the LDC Expert Group on creating NAPs,
13 which encouraged some national level tracking of adaptation (LDC Expert Group, 2012).

14 Adaptation was a theme in the meetings in CoPs 17–20 in Durban, Doha, Warsaw and Lima,
15 but the major outcomes from these meetings were largely focused on extending the Kyoto
16 Protocol and advancing negotiations on a post-2020 agreement, with limited success.

17 CoP 18 at Durban in 2012 did formalise language on ‘Loss and Damage’ (“Durban Agreement
18 to the United Nations Framework Convention on Climate Change,” 2011), which has
19 implications for adaptation, among other things. Applying assessment of loss and damage
20 implies a limit to adaptation, as well as the ability to specify the contribution of anthropogenic
21 forced climate change to climate-related disasters (Huggel et al., 2013; Huq et al., 2013).
22 Nonetheless, the inclusion of a reference to loss and damage in climate change negotiations
23 remains controversial, with concerns from developed countries that they will be held liable for
24 disasters.³

25 Following Copenhagen, CoP 21 in Paris became the focal point for bringing the negotiations
26 on a post-2020 agreement to a successful conclusion based on, among things, the principle that
27 negotiated outcomes should be ‘applicable to all’. A novel outcome of the Agreement was to
28 establish the global goal on adaptation of ‘...enhancing adaptive capacity, strengthening
29 resilience and reducing vulnerability to climate change, with a view to contributing to

³ Note that although Article 8 of the Paris Agreement Article 8 of the Agreement commits Parties to continuing the Warsaw International Mechanism for Loss and Damage associated with Climate Change Impacts Paris, in Decision 52 the parties also agreed that this does not involve or provide a basis for any liability or compensation. These counter-balancing decisions highlight the concern largely of developed countries who have been responsible for the majority of historic emissions.

sustainable development and ensuring an adequate adaptation response in the context of the temperature goal...'. (Article 7, point 1). Article 7 further recognizes that adaptation is a global task faced by all and that the Agreement aims to '...build a collective understanding of adaptation through metrics and tools that capture each country's efforts' (Magnan, 2016). These outcomes signalled a more ambitious, universal and collaborative attitude towards adaptation.

The Paris Agreement strengthened the focus on reporting and assessing adaptation efforts and laid down a challenge for tracking of collective adaptation progress at a global scale (Magnan, 2016). The Adaptation Committee has begun to provide guidance on tracking adaptation (Adaptation Committee, 2016). The 2018 CoP23 in Bonn focused on developing mechanisms to monitor, assess and report the outcomes agreed to in Paris, which is the ongoing focus on the upcoming CoPs. Reporting adaptation as part of this remains an unresolved problem.

The ongoing UNFCCC negotiations, now directed at implementation of the Paris Agreement, has brought with it changing areas of focus in monitoring and tracking adaptation, with the focus shifting from identifying impacts and assessing vulnerability, through project-level and some efforts at national level adaptation tracking through planning, to the current challenge of international level adaptation tracking. International efforts are now recognising these linkages and giving adaptation prominence as a negotiation issue (Helgeson and Ellis, 2015; Magnan and Ribera, 2016). Adaptation is now commonly part of Nationally Determined Contributions (NDCs) and National Communications (NCs) with 137 Parties including an adaptation component in their INDCs (UNFCCC, 2016). At the same time, increasing focus on integrating climate change responses with the Sustainable Development Goals (SDGs) (Ari, 2017; Iyer et al., 2018) is likely to further bring adaptation to the fore, as adaptation actions are often strongly linked to issues of development, disaster management, poverty reduction and other SDG goals. Tracking adaptation at an international scale and comparing efforts and successes of countries with very different contexts remains difficult. Adaptation is often seen as a local issue, resulting in a focus on tracking at a project level, although in practice it takes place in a multi-level governance and multi-sectoral context where responses undertaken in each level and sector is impacted by and impacts the other (Nalau et al., 2015). Adaptation crosses all sectors and influences and is affected by environmental and resource decisions.

As a result, adaptation tracking at a national and international level is difficult. Adaptation invokes consideration of long-term vulnerability, resilience and adaptive capacity – concepts

that are, in themselves, complex and not necessarily amenable to being adequately accounted for by simple indicators (Christiansen et al., 2018; Magnan, 2016). Quantitative or definite goals for adaptation, similar to avoiding 1.5 °C or 2 °C of global warming, have to date not been developed.

Adaptation is a series of ongoing efforts that will need to be reassessed and revised. Assessing these efforts, will have to be, at least in part, about measuring and evaluating related processes, including adaptation planning (Craft and Fisher, 2016).

2.2. Adaptation planning

Adaptation planning is a key component of adaptation processes (Biesbroek et al., 2010; Füssel, 2007; Mullan et al., 2013; Preston et al., 2011; UNFCCC Secretariat, 2016). Effective planning can allow adaptation to become part of long-term decision-making and embed climate change considerations into everyday policy and planning considerations. Planning can operate at timescales relevant to climate change (30–50 years) and provide a focus on addressing responses to future impacts. As noted above, National Adaptation Programmes of Action (NAPA) and National Adaptation Plan (NAP) processes have been part of the UNFCCC system for over a decade (UNFCCC, 2014b, 2014c; UNFCCC Secretariat, 2016), and there has been substantial development of adaptation plans and strategies across Europe and the OECD (Biesbroek et al., 2010; Preston et al., 2011).

The Paris Agreement includes a call for National Adaptation Plans to be submitted to the UNFCCC Secretariat. While the focus on support for LDCs remains, the Agreement encourages the expansion of national adaptation planning to all parties (Adaptation Committee, 2016). Importantly, the CoP 21 decisions regarding implementation of the Agreement requested that the state of adaptation efforts, support, experiences and priorities be included into the global stocktake called for in Article 14 of the Agreement (Decision 100, (a), (ii), page 14). Starting in 2020, all national governments, including OECD countries, are required by the UNFCCC to develop national adaptation plans.

NAPAs and NAPs have evolved throughout the UNFCCC negotiations. The need for and aims of the NAPAs were outlined at CoP 7 in Marrakesh, and the agreement included guidelines for NAPAs, such as the need for it to be country-driven and focus on urgent actions, the need for a participatory, gender equal, multidisciplinary approach that was in line with other international agreements, and also a suggested structure for the plans (“Marrakesh Agreement to the United Nations Framework Convention on Climate Change,” 2001). The Marrakesh

1 Accords also set up a Least Developed Country Expert Group (LEG) to provide guidance and
2 advice on the preparation and implementation strategy for NAPAs. As a result, they all take a
3 similar approach, which includes participatory consultations and detailed analyses of impacts
4 of climate change, vulnerability and prioritisation of action. A process for developing NAPs
5 was established somewhat later under the Cancun Adaptation Framework (CAF) agreed to at
6 CoP 16. The focus of NAPs is identifying medium- and long-term adaptation needs, as well
7 as strategies and programmes to address those needs. Technical guidelines for the NAP process
8 were prepared by the LEG and consisted of four elements: (1) Lay the Groundwork and Assess
9 Gaps; (2) Preparatory Elements; (3) Implementation Strategies; and (4) Reporting Monitoring
10 and Review. Each element contains steps that should be undertaken as part of the NAP process.
11 Again, this has resulted in a similar approach and commonalities between the NAPs.

12 Many developed countries have also produced national adaptation plans or strategies
13 (Biesbroek et al., 2010; Mullan et al., 2013; Preston et al., 2011). These are often undertaken
14 independently of the UNFCCC processes and do not refer directly to their guidelines. In some
15 cases, the adaptation strategy has led to further national policies such as national plans that lay
16 out, for example, projects and actions.

17 NAPAs, NAPs and NASs are all types of formal adaptation plans. NAPAs and the majority of
18 NAPs have been created under UNFCCC processes and guidelines. The NAPAs were the
19 earliest attempts at adaptation planning, and were specifically aimed at supporting LDCs in
20 addressing climate change impacts. As their name (Programmes of Action) suggests, they were
21 focused on establishing and implementing a range of projects designed to address urgent and
22 immediate needs prioritised by the individual countries. Most NAPs have also been developed
23 through the UNFCCC process. In contrast to the NAPAs, NAPs are more strategically focused,
24 i.e. not always including specific projects but more general goals. Like the NAPAs, however,
25 they have been developed through participatory processes and are designed to address national
26 vulnerabilities, needs and priorities in a context-specific manner. Note that some developed
27 countries have developed their own NAPs separate from the UNFCCC-derived process. These
28 serve much the same purpose but are often bureaucratic, government exercises in planning.
29 Some of these are called 'strategies', rather than plans. Although technically a strategy can be
30 different to a plan, being more high level and less action-oriented, the difference between
31 strategies and plans are in practice often limited – most NAPs are strategic plans. For the
32 analysis here, the intentions, goals and themes within the plan or strategy are most relevant and
33 hence they are treated together.

1 Article 7 of the Paris Agreement is in many ways a distillation of the knowledge, guidelines
2 and lessons from the NAPA/NAP process. Consideration of Article 7 and its implications for
3 adaptation planning reveals several key themes, guidelines and elements relevant to adaptation
4 planning that new or updated plans or strategies should reflect (Figure 2). Note that these
5 themes guidelines and elements are generic due to the nature of the Agreement and it being
6 fundamentally a process of diplomatic negotiations between state parties. However, the plans
7 and strategies still do provide insights into international thinking and priorities for adaptation.

8 Here, we suggest that the identified themes, guidelines and elements provide the basis for
9 criteria to assess the NAPs. Note that this analysis is not designed to evaluate the effectiveness
10 of adaptation actions. Such an analysis requires detailed on-the-ground research over long time-
11 periods in relation to the adaptation interventions that have been implemented in response to
12 specified climate-related risks. Instead, the analysis here aimed to provide insight into the
13 extent to which existing plans reflect the requirements of the Paris Agreement, in turn
14 highlighting what these Paris Agreement based criteria for a NAP might mean for national
15 adaptation planning that aligns with international considerations.

Paragraph	Themes, guidelines and elements
1	Goals <ul style="list-style-type: none"> Parties hereby establish the global goal on adaptation of enhancing adaptive capacity, strengthening resilience and reducing vulnerability to climate change, with a view to contributing to sustainable development and ensuring an adequate adaptation response in the context of the temperature goal referred to in Article 2.
2	Integration; Goals; Support for developing countries <ul style="list-style-type: none"> Parties recognize that adaptation is a global challenge faced by all with local, subnational, national, regional and international dimensions, and that it is a key component of and makes a contribution to the long-term global response to climate change to protect people, livelihoods and ecosystems, taking into account the urgent and immediate needs of those developing country Parties that are particularly vulnerable to the adverse effects of climate change.
3	UNFCCC Process
4	Goals; Integration <ul style="list-style-type: none"> Parties recognize that the current need for adaptation is significant and that greater levels of mitigation can reduce the need for additional adaptation efforts, and that greater adaptation needs can involve greater adaptation costs.
5	Participation; Integration; Knowledge; <ul style="list-style-type: none"> Parties acknowledge that adaptation action should follow a country-driven, gender-responsive, participatory and fully transparent approach, taking into consideration vulnerable groups, communities and ecosystems, and should be based on and guided by the best available science and, as appropriate, traditional knowledge, knowledge of indigenous peoples and local knowledge systems, with a view to integrating adaptation into relevant socioeconomic and environmental policies and actions, where appropriate.
6	Support for developing countries <ul style="list-style-type: none"> Parties recognize the importance of support for and international cooperation on adaptation efforts and the importance of taking into account the needs of developing country Parties, especially those that are particularly vulnerable to the adverse effects of climate change
7	Knowledge; Integration; Support for developing countries; Goals <ul style="list-style-type: none"> Parties should strengthen their cooperation on enhancing action on adaptation, taking into account the Cancun Adaptation Framework, including with regard to: <ul style="list-style-type: none"> (a) Sharing information, good practices, experiences and lessons learned, including, as appropriate, as these relate to science, planning, policies and implementation in relation to adaptation actions; (b) Strengthening institutional arrangements, including those under the Convention that serve this Agreement, to support the synthesis of relevant information and knowledge, and the provision of technical support and guidance to Parties; (c) Strengthening scientific knowledge on climate, including research, systematic observation of the climate system and early warning systems, in a manner that informs climate services and supports decision-making; (d) Assisting developing country Parties in identifying effective adaptation practices, adaptation needs, priorities, support provided and received for adaptation actions and efforts, and challenges and gaps, in a manner consistent with encouraging good practices; (e) Improving the effectiveness and durability of adaptation actions
8	UNFCCC Process
9	Planning elements; Integration, Goals <ul style="list-style-type: none"> Each Party shall, as appropriate, engage in adaptation planning processes and the implementation of actions, including the development or enhancement of relevant plans, policies and/or contributions, which may include: <ul style="list-style-type: none"> (a) The implementation of adaptation actions, undertakings and/or efforts; (b) The process to formulate and implement national adaptation plans; (c) The assessment of climate change impacts and vulnerability, with a view to formulating nationally determined prioritized actions, taking into account vulnerable people, places and ecosystems; (d) Monitoring and evaluating and learning from adaptation plans, policies, programmes and actions; and (e) Building the resilience of socioeconomic and ecological systems, including through economic diversification and sustainable management of natural resources.
10-14	UNFCCC Process

Figure 2: Themes, guidance and elements relevant to adaptation planning in Article 7 of the Paris Agreement. The planning themes reflected in Article 7 (goals (red), integration (orange), knowledge (purple), support for developing countries (green) and planning elements (blue) are colour-coded, and the paragraphs of Article 7 is reproduced with text relevant to each theme highlighted in colour.

3. Methods

The analysis involved an assessment of all National Adaptation Plans/Strategies available in English based on the criteria identified from themes, guidance and elements identified in the Paris Agreement.

Table 1 Breakdown of adaptation plans analysed in this study.

Type of Adaptation Plan	Number of Countries
NAPA	38
NAP (developing countries)	6
NAS or NAP (developed countries)	10
Total	54

National Adaptation Programmes of Action (NAPAs), National Adaptation Plans (NAPs) and National Adaptation Strategies (NASs) were sourced from those available from the UNFCCC and those available from EUadapt. In addition, a Google search was conducted for national adaptation plans. Only plans in English were analysed at this stage. In total, 54 plans were analysed: 38 NAPAs, 6 NAPs from developing countries (submitted to UNFCCC) and 10 NAPs/NASs from developing countries (Table 1). This is not exhaustive as new plans are being developed consistently and some plans were only available in languages other than English but we did not have the resources to get them translated.

Although NAPs and NAPAs and NASs can have different specific aims, they all share the purpose of creating adaptation planning, and hence were all assessed here. Where a country had produced both a NAPA and an NAP, e.g. for Burkina Faso and Sudan, only the NAP was included on the assumption that this superseded the NAPA. In the case of developed country strategies and plans, often they have led to other national policy and programmatic documents that lay out projects and actions or perform assessment, e.g.: Germany has produced a German Strategy for Adaptation to Climate Change and an Actions Plan; Denmark has a Strategy for Adaptation to a Changing Climate, an Adaptation Plan and an Impact Assessment. Where available in English, these documents were included in the analysis where criteria dictated.

The criteria were developed from the Paris Agreement following the approach of Preston et al. (2011). Using expert analysis of the text of Article 7, 24 criteria were identified (Table 2) based on the identification of different themes, guidelines and elements discussed in the Introduction

(Figure 2). Each paragraph of Article 7 highlighted a different concept of number of concepts, and the authors developed a criteria based on the concept, using expert analysis and knowledge of climate change adaptation to separate and collate the different concepts.

Table 2: Criteria developed from Article 7 of the Paris Agreement, colour coded by theme, guidelines and elements (as discussed in the introduction): goals (red); integration (orange); knowledge (purple); supporting for developing countries (green); and planning elements (blue).

Criteria	Paragraph of Article 7
Does the NAP approach adaptation through enhancing adaptive capacity, strengthening resilience, reducing vulnerability?	1
Does the NAP give consideration to different scales?	2
Does the NAP consider protecting people, livelihoods and ecosystems (and give these equal weighting)?	2
Does the NAP identify current and immediate need for adaptation?	2, 4
Does the NAP consider or make reference to mitigation actions?	4
Does the NAP consider needs of the country?	5
Does the NAP consider gender as an issue in adaptation?	5
Is there significant participation involved in creating and implementing the NAP?	5
Are vulnerable groups and communities identified and actions for them included in the NAP?	5
Are vulnerable ecosystems identified and actions for them included in the NAP?	5
Is the NAP based on the best available science?	5
Are traditional knowledge, knowledge of indigenous peoples and local knowledge systems included in the NAP?	5
Does the NAP include integration of adaptation into relevant socioeconomic and environmental policies and actions?	5
Does the NAP include support for developing countries? (not applicable to developing countries)	6
Does the NAP include international cooperation?	7
Does the NAP report existing implementation of actions?	9
Is the process for formulating and implementing the NAP clear?	9
Does the NAP include assessment of impacts and vulnerability?	9
Does the NAP include prioritised actions?	9
Does the NAP consider monitoring and evaluation?	9
Does the NAP include actions that will build the resilience of socioeconomic systems?	9
Does the NAP include actions that will build the resilience of ecological systems?	9
Does the NAP include economic diversification?	9
Does the NAP include sustainable management of natural resources?	9

The scoring system was based on Preston et al. (2011) (Table 3) and used to develop specific qualitative scoring for each criteria (see Table S1 for more detail) based on expert knowledge. The range and nature of the criteria are such that interpretation of these conditions is necessary. A complete description of the specific scoring basis for each criterion is available in the Supplementary Information.

Table 3 Basis of scoring of criteria in plans, from Preston et al. (2011).

Score	Necessary Conditions
0	No evidence of consideration for a particular criterion was apparent within the published plan. This suggests a particular concept or planning process was neglected
1	Evidence exists of consideration of a particular criterion during the development of the adaptation plan. This suggests the concept or process in question was recognized or acknowledged as being of some importance. However, the concept or process remained underdeveloped, suggesting additional consideration may be required for robust planning.
2	Evidence exists of consideration of a particular criterion during the development of the adaptation plan and significant effort was invested as part of the planning process (or prior to the planning process) to establish a particular criterion or complete a particular process.

Each plan was rated according to the criteria outlined in Table 2 based on the expert evaluation of the authors. The plans were critically read to identify evidence for the concepts or processes within each criteria. The expert evaluation looked in the text for key terms in relation to each criterion, such as ‘adaptive capacity, resilience and vulnerability’ for criterion 1, to answer the question posed for each criteria in Table S2. If the concepts or processes relevant for each criteria were found, we then considered how deeply the concept or process was reflected within the plan with a score of ‘2’ if well developed or ‘1’ if only mentioned or just acknowledged.. Where the ideas relevant to a criteria were the basis for actions, projects or processes within the plan then the plan was given a score of 2. For example, many plans simply mentioned gender equality as important (and scored 1) but some plans described processes that address this theme with specific actions such as separate workshops for women in the plan consultation stage or included specific objectives or actions to address gender inequality involving projects aimed at supporting women; these would score 2. For criteria that included more than one concept or process, such as ‘Criteria 3: protecting people, livelihoods and ecosystems’, we made a judgement on how the plan balanced these different concepts. For example, most NAPAs emphasised people and livelihoods over the environment, with projects having a social development component but fewer having an environmental focus. To receive the higher score, the plan had to have some balance between the different concepts so that a plan with a primary focus on development would only score 1. Similarly, assessing whether the plan included adaptive capacity, resilience and vulnerability, each term was searched for in the document. If each term was mentioned a score of 2 was given, if only one or two of the three terms were mentioned, then a score of 1 was given.

The results were stored in an Excel spreadsheet, with evidence provided for each score (such as quotations from plans and description of elements included/excluded (details provided in the Supplementary Information). Given that the scores were partly relative and subjective, the authors independently assessed and the crosschecked the scoring to help ensure a level of rigour and consistency in how the scoring system was applied. The analysis mainly considers the inclusion of concepts within the plan, rather than detailed evaluation of them. For example, criteria around Monitoring and Evaluation (M&E) were based on the description of some sort of M&E process within the plans, rather than an evaluation of whether the M&E in the plans was suitable or likely to be effective, which was not impossible within the scope of a desktop review.

Note that the criterion 14 ‘Does the NAP include support for developing countries?’ was not applicable to developing countries and LDCs. Consequently, this criterion was not included in the final aggregate score of the plans to avoid bias. The maximum score possible for all countries therefore was 46. However, the criterion was still assessed, and is included in tables in italics, because it was considered an important element of the Paris Agreement, reflecting the emphasis placed on supporting developing countries as part of a just and equitable response to climate change. This criterion therefore provides insight into how developed countries prioritise support for other nations (see Results).

The adaptation planning scores were then plotted against available global data sets that provided national level indicators of: (1) vulnerability (Notre Dame Global Adaptation Initiative, 2018), (2) exposure (Notre Dame Global Adaptation Initiative, 2018), (3) GDP per capita (World Bank, 2018), and (4) CO₂ emissions per capita data (World Bank 2018) at a national level. Values for the scores and other climate-related and socio-economic factors for each nation were graphed using scatter plots for their relationships for visualisation purposes. The purpose of this exploratory analysis was to investigate whether there was any indication that the standard of a nation’s adaptation plan may be related to documented climate-related pressures or socio-economic conditions.

4. Results

The scores from assessing the 54 adaptation plans ranged from 18 to 38 out of possible maximum of 46 (Figure 3, Table S2). (Figure 3, Table S2). Plans that scored less than 25 reflect overall weaker alignment of Paris criteria whereas plans that scored over 35 show high

correlation with Article 7. The majority of plans scored close to the average score of 31 (32/54 scoring between 29 and 33).

Figure 3: Scores for adaptation plans based on criteria developed from the Paris Agreement. Countries with lower adaptation planning scores reflect weaker alignment with the criteria derived from Article 7 of the Paris Agreement.

In order to investigate whether the adaptation plan scores are related to documented climate-related pressures or socio-economic conditions, the total plan score (out of 46) was plotted against existing measures of vulnerability, GDP, exposure and carbon emissions. The plot of adaptation plan scores and vulnerability index values (Figure 4A), suggests that countries that are more vulnerable generally have plans more closely aligned to the Paris Agreement. Note, however, that the way the vulnerability index is calculated means it is strongly linked to development and GDP and other social pressures; hence the very high vulnerability for Somalia and Niger. This link to GDP is highlighted when plotting adaptation plan scores to GDP per capita, which shows the same clustering of richer, developed countries with lower adaptation plan scores and poorer developing countries with generally higher scores (Figure 4B). This strong dependence of vulnerability on GDP hides some important adaptation issues such as although wealthier countries might be seen as less vulnerable because their adaptive capacity is greater, they still need good planning to mobilise this capacity effectively. On the other hand, developed countries still need good adaptation planning to be resilient, even if their vulnerability appears low.

Figure 4: (A) Adaptation plan scores vs. vulnerability (2016) score from NDGAIN. (B) Adaptation Plan score vs. GDP per capita (2016, from World Bank).

Comparing the adaptation planning score with exposure instead of vulnerability helped to tease out some of the effects of wealth and development (Figure 5). Although the trend is similar, there are outliers such as Japan and Australia that face significant exposure but whose plans are less aligned to the Paris Agreement. Spain also scores lower but has less exposure. Overall, there is less of a difference between developed and developing countries than what is inferred from considering just the aggregate vulnerability index. Similarly, the more exposed LDCs have clearly benefited from plans developed through the NAPA process, although some of the most highly exposed countries only score around average.

Figure 5: Adaptation plan score vs. exposure (2016) from ND-GAIN.

Comparing the adaptation plan score to CO₂ per capita is also informative, especially considering the linkages between mitigation and adaptation (Figure 6). Those countries with greater per capita emissions tend to have lower adaptation plan scores, while those with higher plan scores have similar (and low) per capita emissions. Those countries that have plans less aligned to Paris are those that will need to make the biggest contribution to mitigation. Hence, future NDCs of these countries may require greater commitments on both mitigation and adaptation. At the same time, the data reflect the controversial discussions over responsibility for funding adaptation costs in developing countries as well as the loss and damage issue (Lees, 2017).

Figure 6: Adaptation plan score vs. CO₂ per capita 2014 (from World Bank, 2018).

Although the overall score reveals some general trends in terms of alignment with the Paris Agreement, more details on how particular plans align are revealed by the scores for each criterion (Tables 4 and 5). Firstly, there are some common features between the plans: ‘vulnerability and impact assessments’ (criteria 18 - 46 out of 54 adaptation plans scoring 2); ‘the use of the best available science’ (criteria 11- 54/54 scoring 2); ‘prioritisation of actions’ (criteria 19 - 47/54 scoring 2); ‘integration with existing policies’ (criteria 13 - 47/54 scoring 2); ‘including actions that will build the resilience of socioeconomic systems’ (criteria 21- 44/54 scoring 2); and ‘a country-specific focus’ (criteria 6 - 54/54 scoring 2). One criterion where all plans score highly is ‘meeting the needs of the country’ (criteria 6; 54/54 score 2). Also, 48/54 scored 2 on ‘integration of adaptation into relevant socioeconomic and environmental policies’.

Table 4 Scores recorded for each criterion developed from Article 7 of the Paris Agreement, see Table 2 for details of criteria. The right hand side reports how many countries scored 1 or 2 in their plans for all countries and a breakdown by developed and developing/LDC countries.

Criteria		Number of Countries scoring 1 or 2					
		All		Developed		Developing	
		1	2	1	2	1	2
1	Adaptive capacity, resilience and vulnerability	31	23	7	3	24	20

Despite the relative consistency, there are also some key differences between plans. Aspects that are usually present only in higher scoring plans are: ‘consideration of previous/current adaptation actions’ (27/54 plans scoring 2); ‘use of local/traditional/Indigenous knowledge’ (6/54, plans scoring 2, sometimes out of necessity when science is limited), and ‘considering mitigation actions’ (4/54 scoring 2). Finally, plans with higher scores tended to explicitly include ‘vulnerability, adaptive capacity and resilience’ within the plan. Many plans, especially earlier NAPAs, tended to focus on vulnerability and adaptive capacity. In many of these cases, the plans would also lead to increase resilience as well, but addressing resilience is not explicitly part of the adaptation plan. Where resilience was included, it was often in the context of disaster management and ‘bouncing back’ from impacts.

Plans that scored higher tended to have a strong participatory approach (Table 4). For example, Brazil had a focus on knowledge and identifying vulnerable groups (scoring highly on criteria 8, 9, 11, 12 and 18), which results in the highest overall score. Similarly, Burkina Faso has a strong focus on gender equality and vulnerability of women and participation (scoring high on criteria 7, 8 and 9), which boosts its overall score. Participation and gender were key elements of NAPAs many developing countries score 2 for at least one of these criterion. In contrast, lower scoring plans, especially those from developed countries, have relatively little focus on gender (e.g. Spain and Australia), local and Indigenous knowledge (e.g. Spain) and participation (Turkey and UK).

Only seven of the 54 plans were assessed as giving a balanced account of adaptation with respect to protecting people with these more nature-focused aims (scoring 2 on criteria 3). Similarly, plans that score more highly tend to gain in areas of sustainable resource management (criteria 24) and actions that improve the resilience of ecosystems (criteria 22), as well as balancing livelihood and people protection with ecosystem protection (criteria 10). Very few plans score highly in these areas (criteria 10 4/54 score 2; criteria 22 11/54 score 2; criteria 24 13/54 score 2), although these tend to be the highest scoring plans. For example, Brazil’s NAP includes consideration of ecosystem-based adaptation – ‘Promote and integrate a crosscutting Ecosystems-based Adaptation (EbA) methodology for all sectors, for use of ecosystem services as an alternative and/or complementary adaptation strategy’ (Ministerio do Meio Ambiente (MMA), 2016, p. 19) – as well as several goals focused on the sustainable management of natural resources. Similarly, Burkina Faso includes sustainable NRM as a ‘sector’ and provides specific objectives and indicators, and Sierra Leone includes projects

specifically aimed at both ecological resilience and sustainable NRM. These are the exceptions though as few plans score well on these more environmentally-focused criteria.

5. Discussion

Although there are trends apparent between overall the adaptation plan score and selected published vulnerability and related indicators, the relationships do not support a clean division between developed and developing countries. The variety and range of criteria mean that a focus on overall scores hides important insights. Combining the general trends with more detailed analysis of the individual criteria scores, collectively and by country, is more revealing

5.1 Consistency of Approach: More Integrated But Not Yet Holistic

Overall, the results suggest that NAPAs and NAPs prepared with support from the UNFCCC (those covering LDCs and developing countries) tend to receive higher adaptation plan scores. We suggest this reflects two factors. First, the text within Article 7 of the Paris agreement has been strongly influenced by the development and experiences of both the NAPA and NAP process within the UNFCCC. Many of the requirements detailed in Article 7 reflect the guidelines outlined by the LEG (LDC Expert Group, 2012), in particular the inclusion of participation, gender, and local/traditional/Indigenous knowledge, where many plans from LDCs score well. The requirements about the urgent and immediate nature of adaptation also reflect the NAPA process (all NAPAs scored 2 in this area). Secondly, the fact that there are consistent scores for several criteria even across the developed country plans potentially reflects a broad agreement on at least some aspects of adaptation planning (Table 4, see also Table S3 for ranked criteria).

Most plans scored well in a shared set of indicators: ‘assessments of vulnerability and impact’; ‘the use of the best available science’; ‘prioritisation of actions’; ‘integration with existing policies’; ‘building the resilience of socioeconomic systems’; and ‘having a country-specific focus’. This suggests that these criteria represent elements that are widely accepted as important for adaptation. The focus on integration is encouraging and suggests that the opportunities to mainstream adaptation are at least being recognised. This is perhaps related to the close relationship between adaptation and development and disaster management, all of which are high and immediate priorities across the countries. The need to address what are typically seen as more immediate risks provides an opportunity for policy-makers to mainstream at least some elements of adaptation planning. Identifying vulnerable ecosystems (47/54 scoring 1), and consideration of different scales (40/54 scoring 1) were also common

1 across the plans, but were less well developed. This suggests that scale and ecosystem
2 considerations are becoming more important, but are not yet fully incorporated into planning.

3 The human-centred nature of planning, traditionally focused on economic development and
4 managing population growth, means consideration of ecosystems is still a relatively new
5 feature of adaptation planning. However, resource scarcity and greater understanding and
6 awareness of human impacts on ecosystems, combined with the growing understanding of the
7 benefits ecosystem services provide to people, mean that natural resource management is an
8 increasing part of strategic planning at all levels. This brings with it new consideration of
9 scales, reflected in moves towards more regional or catchment-scale planning, which is also
10 encouraged by more holistic approaches, improved cross-sectoral collaborations and more
11 polycentric governance (Nalau et al., 2015; Robinson et al., 2011; Selman, 2006).

12 NAPs developed outside the UNFCCC process tended to score lower on participation and
13 inclusion of traditional/local/Indigenous knowledge (see e.g. low scores for European
14 countries). Developing and less developed countries often include significant stakeholder
15 engagement in development and some go further. Sri Lanka includes a specific project to
16 ‘Study and Identify traditional methods of biodiversity management in agro ecosystems’
17 (Ministry of Mahaweli Development and Environment, 2016, p. 79) and countries such as
18 Tuvalu, Uganda and Gambia specifically document or set out to document stakeholder
19 knowledge.

20 The key differences between plans developed outside the UNFCCC process (scoring lower on
21 participation and inclusion of traditional/local/Indigenous knowledge) reflects the UNFCCC
22 NAPA and NAP processes that emphasise the importance of participation and local knowledge
23 In contrast, NAPs of developing countries were more expert-based and technocratic. It should
24 be noted, however, that participation is often part of developed countries NAPs or NASs –
25 local-scale action is often the aim within them, but their formulation remains centralised and
26 technocratic. Note, however, that participation within the planning process is widely
27 recognised as key to effective planning, in particular for getting ‘buy in’ from stakeholders,
28 which is more likely to result in action. This suggests that developed countries might have
29 something to learn from the processes in developing countries if alignment of adaptation
30 planning at the international level is to include greater participation.

31 **5.2 The Flexibility of Adaptation: Adaptation vs. Development**

1 The plans also demonstrate that adaptation as a concept is highly malleable. The plans exist in
2 varying contexts, geographies, politics and economies, and yet adaptation planning sufficiently
3 flexible as a concept to ‘meet the needs’ of all countries – as defined by the countries in their
4 planning process. At the same time, adaptation planning can be used to harness resources for a
5 wide variety of goals and projects. This is highlighted by the NAPAs where adaptation is often
6 presented as activities contributing to development, especially agricultural development, water
7 management and disaster relief.

8 This might suggest that any development measure that addresses poverty is a valid and sensible
9 adaptation option. However, equity (Mearns and Norton, 2010), maladaptation (Barnett et al.,
10 2015) and redistribution (Atteridge and Remling, 2017) must be considered. This adaptation
11 versus development challenge is well recognised in the literature, and debate continues as to
12 what should be considered adaptation and what is solely development (Adams and Falzon,
13 2017). This is not just an academic debate as the lack of clarity on the differences risks derailing
14 or slowing funding available as parties fail to agree what can and cannot be included in
15 adaptation funding. Adaptation planning will both guide, and be influenced by, funding.
16 Adaptation planning will provide the focal points for planning within a country. However, in
17 those places looking to international funds for projects, adaptation planning will be in part
18 determined by what the international community see as adaptation, including what is defined
19 as high adaptation priorities in the national plans.

20 One interesting aspect of the role of development in adaptation is the inclusion of help for
21 developing countries in national planning. Adaptation planning at a national scale is focused
22 on the needs of a country. However, Article 7 of the Paris Agreement includes an agreement
23 to support the adaptation of developing countries. This raises an interesting question of whether
24 support for other countries should be included within national adaptation planning or remain
25 separate from it, such as only being included in NDCs. Six out of ten developed countries
26 included this support within their national plans in some form, although only Japan and
27 Germany scored 2 on this element of their plans. This suggests that, despite the national focus,
28 some developed countries recognise the importance of supporting developing countries as part
29 of a national adaptation strategy. There are reasons countries might consider supporting other
30 countries in a national adaptation plan including that adaptation, like mitigation, has
31 transboundary implications. For example, impacts of climate change could create mass
32 migration from countries unable to adapt. As building support for developing countries into the

national plan strengthens commitments made under international agreements, it could also be argued that having support for other nations better reflects the ‘spirit’ of the Paris Agreement.

Overall, although this ‘malleability’ of adaptation provides the potential for adaptation to be co-opted to achieve goals that might not address vulnerability, resilience or adaptive capacity, it has the advantage of supporting the inclusion of adaptation into existing plans and policies, i.e., mainstreaming. This is reflected in the high number of NAPs and NAPAs scoring 2 on integration of adaptation into relevant socioeconomic and environmental policies. Although this does not automatically translate into effective mainstreaming, it does suggest that countries are considering mainstreaming adaptation.

5.3 Socio-economic vs. Ecological Framing

The strong link between adaptation and development also highlights the strong socio-economic framing of the plans. Adaptation plans are often focused principally on protecting people and livelihoods rather than ecosystems and natural resource management (NRM). While this focus is unsurprising, the Paris Agreement specifically identifies protecting biodiversity, ecosystem integrity and NRM as important aspects of climate change response, for adaptation as well as mitigation. This suggests that there is scope to better include an ecological framing into adaptation planning in line with the Paris Agreement commitments.

A greater ecological focus in national adaptation planning will inevitably raise concerns regarding what is conventionally seen as the inevitable trade-offs between environmental, economic or social outcomes. Developing countries, in particular, face difficult choices as following similar historical development paths to the more developed world will reduce their ecological resilience and the flows of ecosystem service benefits, which in turn support social adaptive capacity (Munang et al., 2013a). Adaptation planning can help bring a different focus to development pathways that promotes synergies rather than trade-offs between environmental, social and economic goals.

Including the ecological dimension can help resolve adaptation versus development tensions by encouraging greater attention on nature-based adaptation actions. Conventionally, development has focused primarily on socio-economic objectives, particularly poverty alleviation. A more comprehensive approach is warranted however when it is recognized that both development and adaptation have both social and ecological dimensions, pointing to the value of a socio-ecological systems framing (Berbés-Blázquez et al., 2017) as a core component of sustainability (Eriksen et al., 2011).

1 Considered together these trends reflect the benefits of more holistic approaches widely
2 discussed in the literature: including resilience alongside vulnerability (Salinas Rodriguez et
3 al., 2014; Vogel et al., 2011); incorporating a specific focus on ecosystems (Harvey et al., 2014;
4 Munang et al., 2013b); and ensuring participation (Bauer et al., 2011; Hegger et al., 2012) and
5 inclusion of a wide range of people and knowledge (Hegger et al., 2012; Leonard et al., 2013).
6 Hence, the requirements of Article 7 in the Paris agreement have the potential to encourage a
7 more integrated and comprehensive approach to adaptation planning. Although the first
8 iteration of planning might focus on immediate country needs and vulnerability of people, the
9 next step can be to include ecological vulnerability and resilience and consider vulnerability,
10 resilience and adaptive capacity together as complementary. Planning is, after all, a continuous
11 process, not a once-off and static final outcome.

12 **5.4 Limitations and Further Work**

13 Only adaptation plans in English were considered in this analysis, due to a lack of resources
14 for translation. Future work will add plans in other languages to the analysis. Preston et al.
15 (2011) note some limitations of their method that are applicable here. In particular, the analysis
16 only considers adaptation plans, which are high-level strategic documents that can lack details
17 of specific actions. Also, this analysis only looks at formal processes of adaptation. Some
18 adaptation actions are likely to be informal, implicit and not necessarily recognised as
19 adaptation. The desktop nature of the assessment, and reliance on expert judgement, also limits
20 the analysis and conclusions that can be drawn. The analysis only gives an idea of how national
21 plans align to the Paris Agreement. More detailed assessment, including on ground assessment,
22 would be needed to consider how these plans were developed and critically investigate their
23 implementation, and also how the Paris Agreement guidelines are interpreted by different
24 ministries and sectors and at different scales. However, such plans are important to institutions
25 and organisations, and give good indications of priorities and institutional thinking. Many
26 funders also base their investment decisions on national priorities found in these plans and in
27 many ways such plans have a significant influence as to what gets funded and in which sectors.
28 Also, these plans are in many cases the first generation of national adaptation plans for the
29 countries, and there is a learning process for what is a relatively new idea. What should or
30 should not be included and discussed in adaptation plans is still open for debate, and hopefully
31 this study can inform that discussion. Certainly, later NAPAs and NAPs have benefited from
32 the extensive UNFCCC adaptation planning process. As more countries develop NAPs, there
33 is scope to not only repeat the analysis, but also to compare changes in adaptation plans.

6. Conclusions

This paper sought to evaluate how national climate adaptation policy and planning processes are aligned to Paris Agreement commitments across different countries. We assessed 54 national adaptation plans and strategies using criteria derived from themes, guidance and elements articulated in the Paris Agreement. Our analysis showed that there was significant consistency in approaches to adaptation planning across these plans.

Importantly, most countries failed to include in their planning the ecological framing reflected in the Paris Agreement as a focus on economic and social vulnerability and resilience continues to dominate. While a greater emphasis on an ecological approach can raise concerns for development trade-offs, these can be often resolved by considering synergies and co-benefits such as those associated with ecosystem service benefits and opportunities for green growth (Munang et al., 2013a; Vincent, 2012). The move from NAPAs to NAPs should aim to include this ecological focus, and developed countries and the UNFCCC can support them in this by providing the necessary financial resources for the design and implementation of nature-based solutions. Developed countries also have the opportunity to show leadership in taking an ecological focus within their own plans as they are revised and updated.

The criteria developed provided an approach to assessing how well national adaptation plans align with key themes, guidance and elements of the Paris Agreement. This approach also enabled a comparative analysis, which revealed important differences between developed and developing countries. Drawing upon these results, we have four recommendations that could lead to better planning and assessment criteria:

- Explicitly include vulnerability, adaptive capacity and resilience in adaptation planning, for example through assessments of all three aspects as part of the planning process, to ensure a more holistic approach;
- Ensure the planning process engages with diverse groups and at multiple levels of governance, and considers local, traditional and Indigenous knowledge where applicable;
- Better balance social/economic aspects with the environmental/ecological by ensuring ecosystem assessment, monitoring and enhancement are included in planning across all sectors; and

- Include explanations of how the progress of implementing adaptation plans is assessed as part of the reporting in order to create better understanding what actions and processes countries have taken in fulfilling their reporting requirements.

Importantly, adaptation planning guided by international cooperation and mechanisms such as the Paris Agreement can help to ensure the continued mobilisation of the parties, guide adaptation planning nationally, and support global-scale consistency in planning and action.
