Key indicators: single-crystal X-ray study; $T = 295$ K; mean $\sigma(\text{C}-\text{C}) = 0.005$ Å; R factor = 0.057; wR factor = 0.166; data-to-parameter ratio = 14.2.

The title compound, $\text{C}_{18}\text{H}_{20}\text{ClNO}_4$, was synthesized during the generation of a combinatorial library based on the fungal natural product 3-chloro-4-hydroxyphenylacetamide. It crystallizes as discrete molecules linked by intermolecular $\text{C}(9)$ chains of $\text{N}-\text{H}\cdots\text{O}$ and $\text{O}-\text{H}\cdots\text{O}$ hydrogen bonds which in turn combine to form chains of $R_2^2(20)$ rings.

2-(3-Chloro-4-hydroxyphenyl)-*N*-(3,4-dimethoxyphenethyl)acetamide

R. A. Davis and P. C. Healy

Comment

The title compound (I) was synthesized during the generation of a combinatorial library based on the fungal natural product 3-chloro-4-hydroxyphenylacetamide (Davis *et al.*, 2005, 2007). Compound (I) was shown to display moderate cytotoxicity towards the human melanoma cell line MM96L with 94% inhibition at 100 $\mu\text{g ml}^{-1}$ (Davis *et al.*, 2007).

This compound crystallizes as discrete molecules with three planar components: the acetamide group (C7—C8(O8)—N1—C9), the 3-chloro-4-hydroxyphenyl group (C1—C7, O4, Cl3), and the 3,4-dimethoxybenzyl group (C11—C16, C10, O13—C17, O14—C18), Fig. 1. The C9—C10—C11—C16 and C2—C1—C7—C8 torsion angles are $-91.8(4)^\circ$ and $-78.9(4)^\circ$ respectively. In the crystal structure the amide (N1) and hydroxy (O4) groups form C(9) chains (Bernstein *et al.*, 1995) of intermolecular N—H \cdots O and O—H \cdots O hydrogen bonds with the methoxy oxygen (O14) and the carbonyl oxygen (O8), respectively (Table 1) which in turn combine to form chains of $R_2^2(20)$ rings (Fig. 2).

Experimental

Compound (I) was prepared as previously reported (Davis *et al.*, 2007). Crystals suitable for X-ray diffraction studies were obtained by slow evaporation of a n-hexane/ethyl acetate (1:1) solution of (I); m.p. 421–423 K.

Refinement

The carbon-bound H atoms were constrained as riding atoms with C—H = 0.95–0.96 Å. The amide and hydroxyl protons were located in difference Fourier maps and constrained with N—H, O—H = 0.90 Å. $U_{\text{iso}}(\text{H})$ values were set at $1.2U_{\text{eq}}$ of the parent atom.

Figures

Fig. 2. View of the intramolecular N—H \cdots O and O—H \cdots O hydrogen bonding (dashed lines) in (I).

Special details

Experimental. The scan width was $(1.68 + 0.30\tan\theta)^\circ$ with an ω scan speed of 16° per minute (up to 4 scans to achieve $I/\sigma(I) > 10$). Stationary background counts were recorded at each end of the scan, and the scan time:background time ratio was 2:1.

Geometry. Bond distances, angles *etc.* have been calculated using the rounded fractional coordinates. All su's are estimated from the variances of the (full) variance-covariance matrix. The cell e.s.d.'s are taken into account in the estimation of distances, angles and torsion angles

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\sigma(F^2)$ is used only for calculating R -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
